Danny Tuppeny answer at 2018-06-21 3 There's no way to launch an emulator in the browser; I think there is a screenshot that's badly-placed in that article that might have confused things. The screenshot is unrelated to launching emulators. However, launch real emulators (not in the browser) is indeed supported in VS Code. As long as you have >= v0.5.1 of Flutter and v2.13 of the Dart plugin for VS Code, you can indeed launch emulators from the editor. Taken from the release notes: Emulator Launching Emulators can now be launched directly from within Code. If you start debugging without a connected device you'll be presented with a list of emulators on your system to launch. After selecting a device a notification will appear while the device boots and connects. You can also trigger the emulator selection by clicking on No devices in the status bar or by running the Flutter: Launch Emulator command from the command palette. A small Visual Studio Code extention to run Android and iOS Simulators in a click. Link to marketplace: Running iOS simulators only works on Mac with Xcode! Features Select and run your emulator from Visual Studio Code. Open all commands with Cmd-Shift-P and type Emulator or click the Emulator icon in the top right. Requirements Android Studio To run Android emulators you need to have Android studio and already created the Android Virtual Devices. Add the Android Studio emulator script to your settings in Visual Studio Code: You can either set the default path or specify a specific path for each operating system. The default path will always be the fallback. Default: "emulator:emulatorPath": "~/Library/Android/sdk/emulator" Mac: "emulator:emulatorPathMac": "~/Library/Android/sdk/emulator" Linux: "emulator:emulatorPathLinux": "~/Android/Sdk/emulator" Windows: "emulator:emulatorPathWindows": "%Sdk%emulator" or "%C:\Users\\%%AppData%\Local\Android\Sdk\emulator" Your visual studio code settings are found here: File -> Preferences -> Setting -> User Setting -> Extensions -> Emulator Configuration You now have the option to start Android emulators in cold boot modus. Activate it in your settings in Visual Studio Code: Android Cold Boot: true Xcode To run iOS emulators Xcode is required. If your Xcode or simulator is not installed in the default location it is possible to set the correct path of the Simulator.app file: "emulator.simulatorPath": "/Applications/Xcode.app/Contents/Developer/Applications/Simulator.app" License MIT License Copyright (c) 2019 Diemas Michiels Permission is hereby granted, free of charge, to any person obtaining a copy of this software and associated documentation files (the "Software"), to deal in the Software without restriction, including without limitation the rights to use, copy, modify, merge, publish, distribute, sublicense, and/or sell copies of the Software, and to permit persons to whom the Software is furnished to do so, subject to the following conditions: The above copyright notice and this permission notice shall be included in all copies or substantial portions of the Software. Use the following command to create a file containing a description of the available templates. flutter create --list-samples test.json To create one of these samples, use flutter create --sample=widgets.SingleChildScrollView.1 mysample ≠ How to run a Flutter application on a iOS and Android emulator 9 Jul, 2021 · 2 min read When developing hybrids apps, there comes a time where you want to check out your app on certain devices. Luckily we can leverage emulators for this . In today's article, I'll show you how to launch the emulators from within Visual Studio Code. As you may have seen in my previous Flutter introduction article, we can run a basic app by executing flutter run. This command will run our Flutter app, and it actually can run on multiple devices. Running a Flutter app on an iOS emulator Before we get started, make sure you have Xcode installed on your Mac and can open an emulator in general. For this, you need to have downloaded Xcode from the App Store and opened it at least once. From there, the easiest way to go about this is to open your Flutter project in Visual Studio Code. Two great plugins actually help with Flutter development these are: Flutter for Visual Studio Code Dart for Visual Studio Code From here, select a device at the bottom of the screen. This will open up the specific emulator for the device you choose. From there, click the Run and Debug menu on the left, and click the Run icon. This will now load your app on the emulator! And there we go. We have our app running on an iOS emulator. Do note the hot-reload option here. We can quickly restart our app with the latest changes. Running a Flutter app on an Android emulator For android, we need to make sure we have our development studio setup as well. Make sure you download and install Android Studio and follow the installation steps. Also, make sure you have an emulator setup. If you're unsure about these steps, check out the Android article on setting up emulators. With that in place, we can go back to Visual Studio Code and change our device to be the Android emulator. Note: You can also create an emulator from this window Once the emulator is started, open the Run and Debug menu and press the start button. Also, note the hot-reload option from this menu. It's a super quick way to debug and run your apps on a device. Thank you for reading, and let's connect! Thank you for reading my blog. Feel free to subscribe to my email newsletter and connect on Facebook or Twitter Dart Code Dart & Flutter support for Visual Studio Code From Dart code v2.12 you can run Flutter apps in Profile and Release modes. To do this you need to create a launch.json if you don't already have one (by clicking Add Configuration in the dropdown on the Run Side Bar). In the launch config for your flutter app set the flutterMode property to one of debug, profile or release: "configurations": [{ "name": "Flutter", "request": "launch", "type": "dart", "flutterMode": "profile" }] Now when you press F5 to launch the application, the corresponding launch mode will be used. By default, when running in profile mode memory usage will automatically be shown on the status bar. You can control this by setting the showMemoryUsage option in the launch config. You can also enable this for debug builds but be aware that the values reported will not be indicative of the final release build of your application. Flutter Performance Profiling Flutter's Modes
